

12W LED DIMMER WITH SOFT START

Circuit presented here is a LED dimmer with soft start, the project can drive LED up to 12W, the circuit can manage load up to 1Amp continues with 12V Supply. Circuit is built using SG3525 PWM IC and MOSFET IRFR120, SG3525 generates PWM and IRFR120 MOSFET drives 12W Load. BC847 is used to invert the PWM signal from SG3525 to create soft start circuit. SG3525 has soft start function, soft start timing can be slower down by increasing capacitor C2 value to 22uF/16V. Trimmer pot PR1 provided to adjust the frequency 210 Hz to 6.5Khz. Keeping PWM frequency lower is advisable for LED. Intensity of LED can be adjust using slide potentiometer P1. Optional small trimmer pot is provided in case slide pot is not available. I have used LOG slide pot which is used in audio applications, linear pot will have better linear dimming. Duty cycle upper limit can be restricted by changing R2. Use R2 0 Ohms or 1 Ohms for normal 0-100% duty output. The circuit is designed to driver 12V LED or LED panels, don't connect any LED directly to this drive, as LED forward voltage is 3.5V and they need series resistor to control the current. Any LED, LED Panel, Light Pad of 12V and current 10mA to 1Amp can be connected to this drive directly. Direct drive of LED without series resistor is possible by limiting the maximum current, choose appropriate resistor value of R2 to achieve this.

Features

- Supply 12V-15V DC
- LED Load 10mA to 1Amp Continues
- Frequency range 210Hz to 6.5Khz
- Duty Cycle Span 0 to 100%
- D1 Power LED
